Need for Transparency

 Replication crisis in social science (Hunter, 2001; Ioannidis, 2005a; Ioannidis, 2005b)

 Call for transparency across all areas of scholarship (Christensen & Miguel, 2017; Nosek et al., 2015)

• Authors focused on research synthesis and meta-analysis are among the greatest proponents of transparent reporting (APA; 2008; Aytug et al., 2012; Moher et al., 2009)

Transparency in Meta-analysis

• Judgment calls (Aguinis et al., 2011; Geyskins et al., 2009; Wanous et al., 1989)

• Lack of transparency in reporting judgment calls can lead to difficulty in interpreting meta-analytic results (Carlson & Ji, 2011; DeSimone et al., in press)

 A lack of transparency can lead to confusing or conflicting results (Bobko & Stone-Romero, 1998; Ioannidis, 2016; Van Iddekinge et al., 2012)

This Presentation

- Identify best practices and areas for improvement in reporting metaanalytic methodology and results
 - Focus on areas that are particularly relevant or unique to the field of management
- Organized into three sections
 - Search and Coding
 - Data
 - Analysis
- Encourage authors, editors, reviewers, and readers to follow and demand transparent reporting practices in systematic reviews and meta-analyses

Reporting Issues in Search and Coding

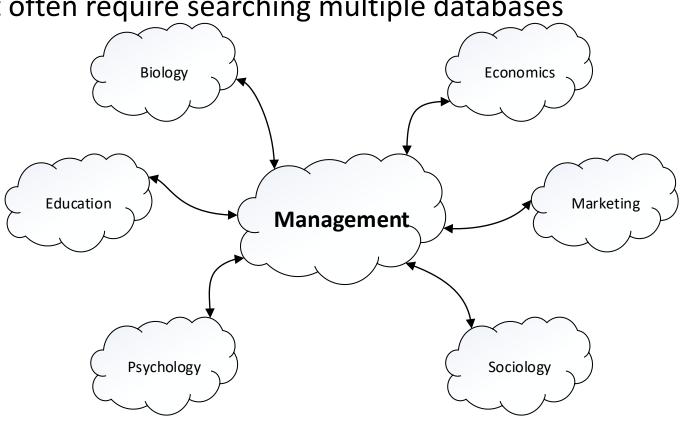

- Management is multidisciplinary by nature
 - Management borrows ideas from a diverse set of disciplines

Meta-analyses in management often require searching multiple databases

Transparent documentation:

Construct definition and scope

- Databases
- Keywords (and combinations)
- Intentional omissions

Construct Clarity

- Context plays an important role in identifying boundary conditions for many management theories
- Some constructs in management exist at different levels
 - They may be conceptualized and operationalized in different ways
 - Clear definitions of constructs and inclusion/exclusion criteria can help avoid confusion or misinterpretation (e.g., ecological fallacy)
- Consider context when reporting inclusion criteria
 - Anticipate potential misperception by readers

Inclusion and Exclusion Criteria

- Existing reporting standards and best practices (e.g., MARS, PRISMA)
 ask meta-analysts to carefully detail decision rules and
 inclusion/exclusion criteria
- Most meta-analyses in management use the Hunter & Schmidt procedure (Aguinis et al., 2011)
 - Favors inclusion over scrutiny of primary study quality
- Document efforts to find unpublished studies, a priori quality standards (Slavin, 1986; 1995), and decision rules or cutoffs

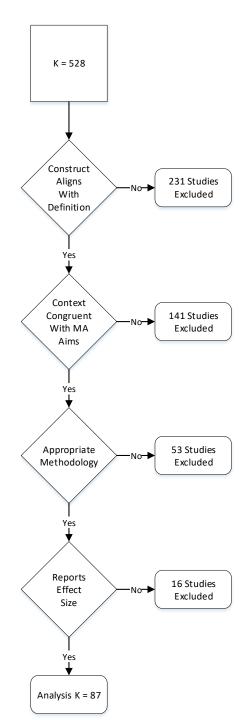

Specify Decision Rules

Construct definitions and constraints

Inclusion/exclusion criteria

Order of application

Limits, cutoffs, and boundary conditions

Meta-Analysis Reporting Standards - Data

CARMA Feb 2019

Data Distribution

Report the Data

- Transparency
 - Error checking
- New methods
- Updates (new meta)

Appendix

Detailed Information on Primary Studies Included in Meta-Analysis

| Study | Outcome | N | r | r_{xx} | r_{yy} | Balance measure | Cluster | Single vs. multi-item |
|-----------------------------|---------|-------|------------------|----------|----------|-----------------------------------------|---------|--------------------------|
| Abendroth & den Dulk (2011) | LS | 5,904 | .43 | .89 | | Valcour (2007) | 1 | Multi-item |
| Ali Omran (2016) | LS | 276 | .54 | .85 | .92 | Carlson et al. (2009) | 4 | Multi-item |
| Aryee et al. (2005) | JS | 267 | 26 | .75 | .82 | Grzywacz and Marks (2000) - WFC | 2 | Multi-item |
| Aryee et al. (2005) | JS | 267 | .28 | .75 | .82 | Grzywacz and Marks (2000) - WFE | 2 | Multi-item |
| Aryee et al. (2005) | JS | 267 | 21 | .76 | .82 | Grzywacz and Marks (2000) - FWC | 2 | Multi-item |
| Aryee et al. (2005) | JS | 267 | .25 | .73 | .82 | Grzywacz and Marks (2000) - FWE | 2 | Multi-item |
| Aziz et al. (2010) | JS | 199 | .01 | .93 | .88 | Fisher et al. (2009) | 2 | Multi-item |
| Bornstein et al. (2003) | LS | 234 | .35 | .70 | | Macphee et al. (1986) | 4 | Multi-item |
| Bryant & Constantine (2006) | JS | 133 | .20 | .76 | .69 | Marks & MacDermid (1996) | 3 | Multi-item |
| Bryant & Constantine (2006) | LS | 133 | .45 | .76 | .91 | Marks & MacDermid (1996) | 3 | Multi-item |
| Cahill et al. (2015) | JS | 2,495 | .40 | .97 | | Valcour (2007) | 1 | Multi-item |
| Carlson et al. (2009) | FS | 685 | .52 | .93 | .94 | Carlson et al. (2009) | 4 | Multi-item |
| Carlson et al. (2009) | JS | 685 | .62 | .93 | .93 | Carlson et al. (2009) | 4 | Multi-item |
| Carvalho & Chambel (2016) | LS | 218 | 16 | .88 | .88 | Carlson et al. (2009) - WFC | 2 | Multi-item |
| Carvalho & Chambel (2016) | LS | 218 | .27 | .96 | .88 | Carlson et al. (2009) - WFE | 2 | Multi-item |
| Chan et al. (2016) | FS | 234 | .29 | .94 | .97 | Brough et al. (2014) | 3 | Multi-item |
| Chan et al. (2016) | JS | 234 | .27 | .94 | .86 | Brough et al. (2014) | 3 | Multi-item |
| Chen & Li (2012) Sample 1 | FS | 204 | .37 | .72 | .95 | Marks & MacDermid (1996) | 3 | Multi-item |
| Chen & Li (2012) Sample 2 | FS | 204 | .47 | .71 | .96 | Marks & MacDermid (1996) | 3 | Multi-item |
| Clark (2000) | JS | 179 | 10 | .86 | .91 | Bohen & Viveros-Long (1981) - WFC & FWC | 6 | Multi-item |
| Clark (2000) | LS | 179 | 15 | .86 | .85 | Bohen & Viveros-Long (1981) - WFC & FWC | 6 | Multi-item |
| Clarke et al. (2004) | JS | 387 | .22 ^b | | | Milkie & Peltola (1999) | 4 | Single-item |
| Clarke et al. (2004) | FS | 387 | .12a | | | Milkie & Peltola (1999) | 4 | Single-item |
| DeHauw (2014) Sample 1 | JS | 395 | .43 | .93 | .88 | Own measure | 4 | Multi-item |

Casper et al. (2018). The jingle-jangle of work-nonwork balance: A comprehensive and meta-analytic review of its meaning and measurement. *Journal of Applied Psychology, 103,* 182-214.

Dependent Effect Sizes

- Within Studies Same People
 - Multiple times (e.g., pre-post)
 - Multiple measures
 - Multiple conditions

- Between Studies
 - Multiple reports of same study
 - Partial overlap between studies
 - Same sample, different authors
 - New meta contains old meta as one estimate; overlap in data
 - Mturk or similar where people may volunteer for multiple studies

Identify dependencies in data.

Describe how you addressed them.

Effect Size Distribution – Visual displays

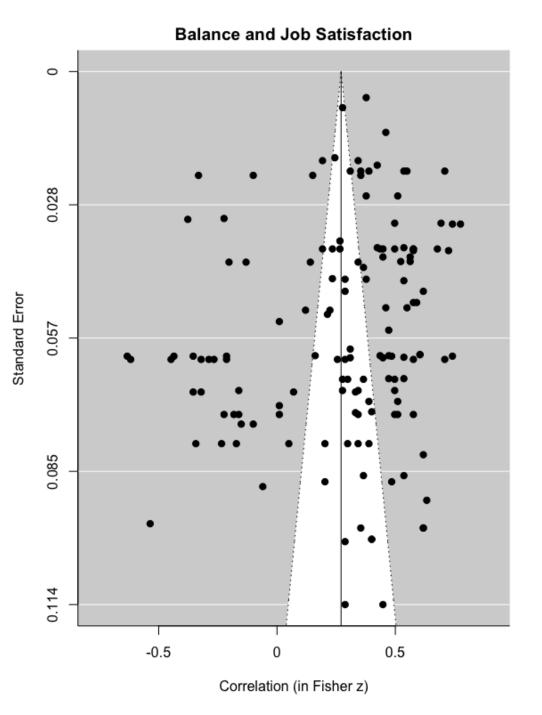

- Forest plots good if there are few studies
- Can show outliers
- Notes
 - Sorted by effect size
 - RE summary of each level (definition of balance)
 - Cluster 2 has extreme range. Coding?
 - Prediction interval (95% PI) at bottom with overall estimate

Work-Life Balance and Job Satisfaction

| Author and Year | | | | ES [95% CI] |
|-------------------------------------------------------------------|------------------|------------------------------------------------|----|----------------------------------------------|
| Wayne et al. (2017) Sample 1 Syrek et al. (2011) Sample 2 | | H=H | | 0.69 [0.63, 0.76] 0.62 [0.43, 0.81] |
| Grawitch et al. (2013) | | H | | 0.62 [0.53, 0.71] |
| Wayne et al. (2017) Sample 2 Ellwart & Konradt (2011) Sample 1 | | ·- | | 0.47 [0.34, 0.60] 0.44 [0.36, 0.51] |
| Cahill et al. (2015) | | H = + | | 0.44 [0.38, 0.46] |
| Ellwart & Konradt (2011) Sample 2 | | | | 0.39 [0.35, 0.43] |
| Syrek et al. (2011) Sample 1 | | | | 0.37 [0.20, 0.53] |
| Parkes & Langford (2008) | | • | | 0.28 [0.26, 0.29] |
| Balance Cluster 1 | | • | | 0.47 [0.38, 0.57] |
| Jia-Fang et al. (2009) | | ⊢•⊣ | | 0.58 [0.43, 0.72] |
| Fisher (2002) Sample 1 | | ⊢•⊣ | | 0.58 [0.46, 0.70] |
| Jia-Fang et al. (2009) | | ⊢•⊣ | | 0.51 [0.37, 0.65] |
| Fisher (2002) Sample 2 | | ⊢• | | 0.48 [0.37, 0.60] |
| Hennessy (2007) | | ⊢• −− | | 0.34 [0.19, 0.50] |
| Aryee et al. (2005) | | ⊢ | | 0.29 [0.17, 0.41] |
| Aryee et al. (2005) | | ⊢• | | 0.26 [0.13, 0.38] |
| Hennessy (2007) | | ⊢ •− | | 0.20 [0.05, 0.36] |

| | | | | |
| -1 | -0.5 | 0.5 | 1 | |
| | Correlation | (in Fisher z) | | |

Funnel Plot & Availability Bias

- Good if large number of studies
- Quick look for bias, outliers, heterogeneity
- Notes
 - If homogeneous, most dots inside white space
 - Huge heterogeneity in these data
 - No obvious association between ES & N (availability)
 - Streaks indicate dependent ES

Effects of Educational Innovations on Learning Outcomes

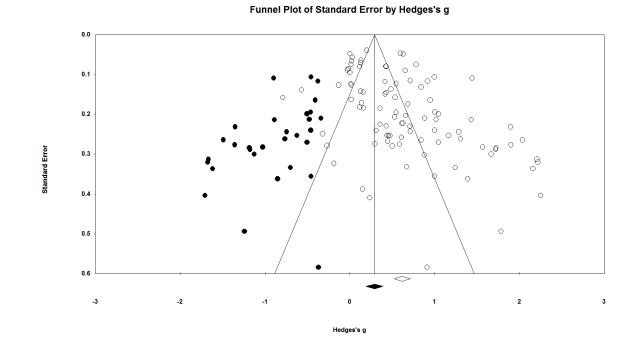

Trim & Fill

Note that the smaller studies show larger effect sizes (open dots)

Imputed studies by trim & fill algorithm are filled in black

Note the difference in the overall estimates

Other methods may be superior for this purpose

Effect Size Conversions

- Nature and Number of Conversions
 - Describe choices and rationale
- Sensitivity Analysis
 - Impact of study type that required conversion

Reporting issues in the analysis

Software

- A lot of variety in software packages
 - Some like R's metafor package are very flexible and can recreate the results from other software packages (e.g., CMA), but depending on settings, you can get different results (e.g., tau, SD-rho)
- Increasingly, a lot of options in these programs
 - Need for the reporting of estimators, thresholds used, etc.

Bivariate Results

- Hunter-Schmidt (psychometric MA) has been dominant paradigm in IO/MGMT
 - Corrected and uncorrected estimates
 - report the standard deviation and standard error of observed and corrected summary effect sizes.
 - These values are relevant to heterogeneity and meta-analytic moderation
 - Corrections used
 - Type(s) of reliability corrected for
 - Type/case of range restriction (if applicable)
 - other artifacts corrected for
 - Whether the corrections were computed based on data reported in the primary study or through artifact distributions
 - Order of corrections

Multivariate Results

- Increasingly common to combine Hunter-Schmidt with Lipsey-Wilson to conduct meta-regression/meta-ANOVA
- Not going to discuss the appropriateness of these combinations, just the reporting of their use
- Same goes for MASEM.

Meta-Regression/Meta-ANOVA

- How weight for artifact-corrected effect sizes were determined
- Whether meta-regression run on corrected or uncorrected effect sizes
- Whether assumptions were met/common sense employed
 - Scatterplots
 - Examination of the residuals
 - Number of included studies in each category

Meta-regression is not immune to regression violations

Mixed-Effects MARA Results

| Variable | Model |
|-------------------------------------|--------------|
| | |
| Performance definition | |
| Accounting measure | .08 (.01)*** |
| Related competitors | .08 (.08) |
| Family firm definition | |
| Ownership definition | 00 (.04) |
| Ownership and management definition | .03 (.05) |
| Self-reported | 16 (.07) |
| Study characteristics | |
| Published | .04 (.02) |
| Publication year | .01 (.01)* |
| Response rate | .23 (.12)* |
| Institutions | |
| Common-law country | .12 (.07)* |
| Rule of law | .05 (.03)* |
| R^2 | .90 |
| k | 37 |

96% of data from Norway

MASEM

- MAs in management routinely combine population estimates from prior MAs with their own findings to test complex models
- Report choice of which past MA to use
- Discuss the independence and comparability of samples across multiple MAs
- Justify the appropriateness of combining meta-analytic findings, as different MAs may have relied on more or less relevant inclusion criteria
- Degree of effect size heterogeneity and the specific procedures used
 - How large were the SD-rho?
- How many elements in the correlation matrices were missing
 - Did it meet MCAR/MAR assumptions?
